"Sequence and expression of a candidate for the human Secretor blood group alpha(1,2)fucosyltransferase gene (FUT2). Homozygosity for an enzyme-inactivating nonsense mutation commonly correlates with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PATHWAY: GLYCOSYLATION TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND BORGELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI.

ALTERNATIVE PRODUCTS: TWO FORMS ARE PRODUCED BY THE USE OF ALTERNATIVE INITIATION CODONS IN THE SAME READING FRAME.

TISSUE SPECIFICITY: SMALL INTESTINE, COLON AND LONG.

MISCELLANROUS: THERE ARE TWO GRNES (FUTI AND FUTZ) WHICH ENCODE GLACATOSIDE 2-1-FUCOSYLTRANSFERASE. THEY ARE EXPRESSED IN A GLACTOSIDE.

TISSUE-SPECIFIC MANNER WITH EXPRESSION RESTRICTED TO CELLS OF MESODERMAL OR ENDODERMAL ORIGIN RESPECTIVELY.

SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 11.
                                                                                                                                                                                                                                                                  Kudo T., Iwasaki H., Nishihara S., Shinya N., Ando T., Narimatsu I.,

Galactoside 2-L-fucosyltransferase 1 (EC 2.4.1.69) (GDP-L-fucose:beta-
D-galactoside 2-alpha-L-fucosyltransferase 1) (Alpha(1,2)FT 1)
                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI.
FISSUE SPECIFICITY: IN THE ADULT, HIGHLY EXPRESSED IN PANCREAS, TESSTE SPECIFICITY: IN THE ADULT, HIGHLY EXPRESSED IN PANCREAS, TESTS AND EPIDIOYMIS AND TO A LESSER EXTENT IN THYMUS, LUNG, STOMACH, SMALL INTESTINE, COLON, SPLEEN AND UTERGS. NOT EXPRESSED IN BRAIN, HEART, SKELETAL MUSCLE, KIDNEY, LIVER AND BONE MARROW.
MISCELLANGOUS: THERE ARE TWO GENES (FUTI AND FOTZ) WHICH ENCODE GALACTOSIDE 2-L-PUCOSILTRANSFERASE.
SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN).

Missense mutation of FUT1 and deletion of FUT2 are responsible for

Indian Bonday Phenotype at ABO blood group system.";

Biochem. Biophys. Res. Commun. 238:21-25(1997).

-!- FUNCTION: CREATES A SOLUBLE PRECURSOR OLIGOSACCHARIDE FUC-ALPHA

((1,2)GALBETA-) CALLED THE H AWTIGEN WHICH IS AN ESSENTIAL

SUBSTRATE FOR THE FINAL STEP IN THE SOLUBLE A AND B ANTIGEN

SUBSTRATES BUT EXHIBIT DIFFERENT KM VALUES.

-!- CATANTY CATIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP +

alpha-L-fucosyl-1,2-beta-D-galactosyl-R.

-!- SUBSELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Finbrillin is the structural subunit of the fimbriae, that are filamentous appendages on the cell surface. Fimbriae of P. gingivalis are recognized as a major virulence factor as they mediate cell adhesion and play an important role in invasion of

                                         The present sequence is given in a specification relating to a rat ganglioside GM 1-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising curalphal-2calbetal-3GalNac.

The method involves contacting alphal-2fucosyltransferase with GDP-fucose or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNac.

The method involves contacting alphal-2fucosyltransferase with GDP-fucose or a precipited sylvoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNac group. It is also useful for synthesis of fucosyl-GM_1 by contacting the protein with GDP-fucose and ganglioside GM_1. The obtained glycoproteins.

Inunuotherapeutic or immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.
                                                                                                                                                                                                                                                           ;

```
This sequence is the human Sec2 protein of the invention. The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2)fucosyltransferase and is the Secretor the DNA is useful for Hood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose.beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allele of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         241 VVTSNGMAWCRENIDTSHGDVVFAGDGIEGSPAKDFALLTQCNHTIMTIGTFGIWANLT 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises porcine secretor glycosyltransferase (SE or FUT2), a type II integral membrane protein has high affinity for type I and type III substrates. Its amino acid sequence was deduced from the nucleotide sequence of a genomic DNA clone (see AAV29003) isolated from a pig liver library on the basis of homology to human FUT2 cDNA. Pig FUT2 shows 81.2% identity with human FUT2. Expression of a glycosyltransferase, such as porcine Se, in a tissue results in reduced expression of unwanted carbohydrate epitopes on the tissue, especially porcine heart, liver, kidney or pancreas, rendering it more suitable for transplantation, i.e. less immunogenic and of increased immunological acceptability. The present invention describes nucleic acids (NA) encoding a chimeric glycosyltransferase. The NAs comprise a catalytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimeric enzyme is located in an area of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT. The NAs can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the epitopes in cells, tissues or organs which may be used in

                                                                                                                                                                                                                                                                                                                                                                                                                         ΠD
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence was given in a specification relating to an isolated rat ganglioside GM_-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-2Galbetal-3GalRAC, a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Rucalphal-2Galbacal-3GalRAC. The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal dabetal-3GalRAC group. It is also useful for synthesis of fucosyl GM_I by contacting the protein with GDP-fucose and ganglioside GM_I The obtained glycoproteins, glycolipoproteins, glycolipids and fucosyl-GM_I configurate are useful as nutritional compositions and fucosyl-GM_I configurate are useful as nutritional compositions and fucosyl-GM_I configurate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New rat ganglioside GMI-specific alphal-2Fucosyltransferase, useful for preparation of fucosyl GMI which is useful as a nutritional composition or immunotherapeutic for cancer and neurological diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is useful for inducing an immunotherapeutic or immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     m
                                                                                                                                                                                                   (alphair2Fuct) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate molety found in ganglioside GM1, a terminal galactose betal-3N-acetylgalactosanhae (albetal-3GalNAc) saccharide. Alphai-2Fuct DNA is useful for producing rat alphai-2Fuct DNA is useful for producing rat alphai-2Fuct DNA is useful for producing rat alphai-2Fuct protein by recombinant techniques. Alphai-2Fuct DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoroteins, Alphai-2Fuct DNA is useful for detecting oncogenic transformation which alphai-2Fuct is activated in cell transformation, antisense sequences derived from alphai-2Fuct DNA are useful for inhibiting, supressing or treating cancer. Alphai-2Fuct DNA is useful in gene therapy and antisense therapy. The present sequence is rat hepatoma H35 cell
                                                                 Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GM1-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STSKALGPSQLRGMWTINAIGRLGNQMGEYATLYALAKMNGRPAFIPAQMHSTLAPIFRI 109

The present sequence is given in a specification relating to a rat ganglioside GM_1-specific alphal-Zfucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-ZGalbetal-3GalNac, a glycolipid, glycoprotein, glycolipid or a free oligosaccharide comprising Fucalphal-ZGalbetal-3GalNac. The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoptotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNac group. It is also oligosaccharide having a terminal Galbetal-3GalNac group. It is also beligosaccharide having a terminal Galbetal-3GalNac group. It is also beligosaccharide and ganglioside GMLI. The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GMLI is useful for inducing an nutritional compositions and fucosyl-GMLI is useful for inducing an neurological disease or small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         m
New rat ganglioside GMI-specific alphal-2Fucosyltransferase, useful for preparation of fucosyl GMI which is useful as a nutritional composition or immunotherapeutic for cancer and neurological diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              196

Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues .
                                               Rat: alphal-2fucosyltransferase; alphal-2FucT; antisense therapy; galactose betal-3N-acetylgalactosamine; Galbetal-3GalNAc; glycolipid; glycoprotein; glycolipoprotein; oligosaccharide; fucosyl-GMI; cancer; gene therapy; oncogenic transformation; cytostatic; ganglioside; GMI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to rat GM1-specific alphal-2fucosyltransferase
                             H35 cell alphal-2FucT catalytic domain.
                                                                                       cell transformation; catalytic domain.

RESULT 9

(FUT1). The specification describes methods relating to Escherichia coli-resistant swine. One of the methods for identifying a swine resistant to E. coli-associated intestinal disorders, comprises determining whether the base at 307 of alpha(1,2) fucosyltransferasel gene (FUT1) is adenine (sic), in which case the swine are resistant. The porcine FUT1 polymorphisms can be used to develop drugs for the treatment of swine having E. coli-associated disease. The methods can in breeding programmes to identify swine with resistance

```
A method has been developed for the identification of swine that are resistant to intestinal colonisation by E. coli. The method comprises determining whether a genetic polymorphism associated with resistance to colonisation is present in a swine sample, and then inferring that the swine is resistant if it is homozygous for the polymorphism. The method uses the swine alpha-1,2-fucosyltransferase (FUTI) polymorphism. The present sequence represents swine FUTI. The method enables the breeding

ñ
of swine that are resistant to E. coll-related diseases. This method general polymorphism in the FUTI gene. More particularly, the identification method identifies swine that are resistant to E. coll-related intestinal disorders if, in a sample are resistant to E. coll-related intestinal disorders if, in a sample Larken, the only nitrogen base at residue 307 in the FUTI gene is adenine. Larger amplified fragments from the assay can be used for RFLP analysis, and the assay itself is used as a basis for a kit, applied to swine of any age, in detecting polymorphisms associated with E. coll FIB.

Teceptors. The polymorphisms are useful in developing drugs to treat swine with E. coll-related diseases. However, a mutated form of the portine FUTI gene may interfere with the normal enzyme and prevent it from producing the intestinal receptor for FIB. The detection and treatment of E. coll-related intestinal diseases in swine, where there has been as the detection and the man and a server and a season of the coll-related intestinal diseases in swine, where there has been as the detection and the man and a season a season and a season and a season and a season and a season a seas

                                                                                                       The amino acid sequence codes for a protein capable of functioning as a GDP- Fuc: Deta-D-Gal alpha(1.2)- fucosyltransferase. The functional protein is represented by amino acids 33 to 365. The enzyme produced by the DNA sequence can be used in enzymatic fucosylation of chain-terminating galactose residues on lactoseramine or neolacto type beta-D-galactoside to aipha-2-L-fucose residues. See also AAR13749-R13752.

is encoded by CDNA (AAQ99461) isolated from a human epidermal carcinome cell line. The enzyme is responsible for the synthesis of 2'-fucosyllactose, one of the oligosaccharides in human milk. Other products of Fuc-T include glycoprotiens contq. beta-linked terminal galactose residues which can be fucosylated by Fuc-T. This DNA can be used to produce non-human transgenic mammals able to produce secondary gene products, e.g. oligosaccharides, in their milk. The transgenic mammals milk biochemically resembles human milk. This humanised milk can be used in the prepn. of an enteral nutritional product useful in the nutritive maintenance of an animal.

                                                                                                                                                                                                                              2-Alpha-fucosyltransferase (AAR70422) is encoded by a cDNA clone (AAR701083) isolated from a human epidermal carcinoma A431 library. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn. of oligosaccharides and glycosylated proteins and lipids in the milk.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alpha-1,2-fucosyltransferase (AAR70421) is encoded by a cDNA clone (AAT01082) isolated from a human epidermal carcinoma cell line A431 cDNA library. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn oligosaccharides or glycosylated proteins and lipids in the milk.

                                                                                                                                                                                                                                                                                                                                                                                                       The human H-transferase (AAR90572) product of a cDNA clone (AAT12238) prepd. from human epidermoid carcinoma cells (ATCC CRL 155 A-431) can be expressed in xenogenetic organs, tissues and cells using a vector such as papex-1 (AAT12239). This results in decreased expression of the non-human antigen galactose alpha(1,3) galactose on the surface of the organs etc. so that hyperacute rejection is reduced upon transplantation to humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      54 ALGPSQLRGMWTINAIGRLGNQMGEYATLYALAKMNGRPAFIPAQMHSTLAPIFRITLPV 113

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-10-040-863-11
